AMENDMENTS TO THE CLAIMS

1. (CURRENTLY AMENDED) A current amplifier cell, comprising:

an input stage suitable for accepting an input signal;

an output stage that generates a first output signal and a second output signal,

wherein the second output signal can be used as a feedback signal to the input

stage in an application into which the current amplifier cell may be placed; and

a gain stage intermediate and coupled to the input and output stages that isolates

the input stage, said gain stage configured in a current mirror configuration and

having equivalent current through the current mirror configuration so as to cause the

first and second output signals to have the same current.

2. (ORIGINAL) The current amplifier cell of claim 1, wherein the input stage further

comprises:

a first transistor having a control terminal and first and second terminals;

a second transistor having a control terminal and first and second terminals; and

a current source having a first terminal and a second terminal;

wherein the first and second transistors are coupled at their control terminals to

receive the input signal, the first terminals of the first and second transistors are

coupled to the first terminal of the current source, the second terminal of the current

source is coupled to a first voltage potential, and the second terminals of the first

and second transistors are coupled to the gain stage.

3. (ORIGINAL) The current amplifier cell of claim 2, wherein the gain stage further

comprises:

a current mirror coupled to the input stage, said current mirror comprising:

a third transistor having a control terminal, a first terminal, and a second terminal;

and

a fourth transistor having a control terminal, a first terminal, and a second terminal;

wherein the second terminal of the first transistor is coupled to the first terminal of

the third transistor and to the output stage of the current amplifier cell, the second

terminal of the second transistor is coupled to the first terminal of the fourth

transistor, the control terminal of the third transistor is coupled to the control terminal

of the fourth transistor and the first terminal of the fourth transistor, and the second

terminals of the third and fourth transistors are coupled to a constant voltage source

and to the output stage of the current amplifier cell.

4. (ORIGINAL) The current amplifier cell of claim 1, wherein the gain stage further

4

comprises:

a current mirror coupled to the input stage, said current mirror comprising:

a first transistor having a control terminal, a first terminal, and a second

terminal; and

a second transistor having a control terminal, a first terminal, and a

second terminal;

wherein the second terminal of the first transistor is coupled to the input stage and

to the output stage of the current amplifier cell, the first terminal of the second

transistor is coupled to the input stage, the control terminal of the first transistor is

coupled to the control terminal of the second transistor and the first terminal of the

second transistor, and the second terminals of the first and second transistors are

coupled to a constant voltage source and to the output stage of the current amplifier

cell.

5. (AMENDED) The current amplifier cell of claim 3, wherein the output stage further

comprises:

a current mirror coupled to the gain stage, said current mirror comprising:

a fifth transistor having a control terminal, a first terminal, and a second terminal;

a sixth transistor having a control terminal, a first terminal, and a second terminal;

and

a capacitive element;

wherein the control terminal of the fifth transistor is coupled to the second terminal of

the first transistor and to the first terminal of the capacitive element, the second

terminal of capacitive element is coupled to a first voltage potential, and the second

terminal of the fifth transistor is coupled to the second terminal of the sixth transistor,

the second terminal of both the fifth transistor and the sixth transistor are coupled to

the second terminal of transistor and the second terminal of transistor, the control

5

terminal of the fifth transistor is coupled to the control terminal of the sixth transistor,

the first terminal of the fifth transistor is coupled to the first terminal of a current

source, the second terminal of current source is coupled to a constant voltage

potential, the first terminal of transistor is coupled to the first terminal of a current

source, the second terminal of current source is coupled to the first voltage potential,

an output originates between the first terminal of the fifth transistor and the first

terminal of the current source, and an output originates between the first terminal of

the sixth transistor and the first terminal of the current source.

6. (AMENDED) The current amplifier cell of claim 1, wherein the output stage further

comprises:

a current mirror coupled to the gain stage, said current mirror comprising:

a first transistor having a control terminal, a first terminal, and a second terminal;

a second transistor having a control terminal, a first terminal, and a second terminal;

and

a capacitive element;

wherein the control terminal of the first transistor is coupled to the input stage and to

the first terminal of the capacitive element, the second terminal of capacitive element

is coupled to a first voltage potential, and the second terminal of the first transistor is

coupled to the second terminal of the second transistor, the second terminal of both

the first_transistor and the second_transistor are coupled to the gain stage, the

control terminal of the first transistor is coupled to the control terminal of the second

transistor, the first terminal of the first transistor is coupled to the first terminal of a

current source, the second terminal of current source is coupled to a constant

voltage potential, the first terminal of transistor is coupled to the first terminal of a

current source, the second terminal of current source is coupled to the first voltage

potential, an output originates between the first terminal of the first transistor and the

first terminal of the current source, and an output originates between the first

terminal of the second transistor and the first terminal of the current source.

7. (ORIGINAL) The current amplifier cell of claim 6, wherein the input signal provided

to the input stage is obtained by coupling a first input terminal of the input stage to

the first voltage potential and coupling a second input terminal of the input stage to a

current source and wherein a gain of the first output signal is determined in

accordance with a resistive element coupled to the second output signal.

8. (ORIGINAL) The current amplifier cell of claim 7, wherein the first input terminal of

the input stage is the control terminal of the first transistor and the second input

terminal of the input stage is the control terminal of the second transistor, and

wherein the resistive element comprises:

a first resistor coupled to the control terminal of the second transistor, the current

source, and the output stage; and

a second resistor coupled between the second output signal and the first voltage

potential.

9. (ORIGINAL) The current amplifier cell of claim 8, wherein the gain of the second

output signal is a real value.

10. (AMENDED) A current amplifier, comprising:

a current amplifier cell, comprising:

an input stage suitable for accepting an input signal;

an output stage that generates a first output signal and a second output signal,

wherein the second output signal is operable as a feedback signal in an application

into which the current amplifier cell may be placed; and

a gain stage intermediate and coupled to the input and output stages that isolates

the input stage, said gain stage configured in a current mirror configuration and

having equivalent current through the current mirror configuration so as to cause the

first and second output signals to have the same current;

a current source coupled to a negative terminal of the current amplifier cell;

a first resistive element coupled between the second output signal of the current

amplifier cell, and the negative terminal of the current amplifier cell; and

a second resistive element coupled between the second output signal of the current

amplifier cell, and a voltage potential.

11. (ORIGINAL) The current amplifier cell of claim 1, wherein the input signal provided

to the input stage is obtained by applying a first voltage potential between a first

input terminal of the input stage and a second voltage potential, and coupling a

second input terminal of the input stage to a first output of the output stage, and

controlling the gain of a second output by connecting the first output of the output

stage to a resistive element which is coupled to a third voltage potential.

12. (ORIGINAL) The current amplifier cell of claim 6, wherein the input signal provided

to the input stage is obtained by applying a first voltage potential between a first

Docket No.: 00-SZ-106

8

input terminal of the input stage and a second voltage potential, and coupling a

second input terminal of the input stage to a first output of the output stage, and

controlling the gain of a second output by connecting the first output of the output

stage to a resistive element which is coupled to a third voltage potential.

13. (ORIGINAL) The current amplifier cell of claim 12, wherein the first input terminal of

the input stage is the control terminal of the first transistor and the second input

terminal of the input stage is the control terminal of the second transistor, and

wherein the resistive element comprises:

a resistor coupled to the control terminal of the second transistor, the current source,

and the first terminal of the fifth transistor of the output stage.

14. (CURRENTLY AMENDED) A voltage-to-current converter, comprising:

a current amplifier cell, comprising:

an input stage suitable for accepting an input signal;

an output stage that generates a first output signal and a second output signal,

wherein the second output signal is operable as a feedback signal to the input stage in

an application into which the current amplifier cell may be placed; and

a gain stage intermediate and coupled to the input and output stages that isolates

the input stage, said gain stage configured in a current mirror configuration and

having equivalent current through the current mirror configuration so as to cause the

first and second output signals to have the same current;

a voltage potential applied between positive and negative terminals of the current amplifier cell; and

a resistive element coupled between the first output and a voltage potential;

15. (ORIGINAL) The voltage-to-current converter of claim 14, wherein the first output is coupled to the negative input terminal.

Docket No.: 00-SZ-106 Application No.: 10/071,013
